(I) have neuroprotective, noctropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harill peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harill peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harill peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnosing Alzheimer's disease, bown's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (WTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP
                                                                                                      Nootropic; neuroprotective; cell death; tissue necrosis; NTP;
neural thread protein; neurodegenerative disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                     Preventing and/or inhibiting cell death and/or tissue necrosis in a tissue for treating a neurodegenerative disorder, e.g. Alzheimer's disease, by contacting the live tissue with at least one segment of neural thread proteins (NTP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Neural thread protein; NTP; Harlil peptide; Alzheimer's disease;

having an amino acid sequence selected from ABBB1511 to ABBB129 and their homologues, which are referred collectively as Harlil peptides (I) [1] have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide sequences can be used an analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics or diagnostics. In particular, the peptides are also useful for diagnostics or diagnostics. Siloblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP).
                           therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nootropic; neuroprotective; cell death; tissue necrosis; NTP;
neural thread protein; neurodegenerative disorder; Alzhelmer's disease.
                                                                                                                                                                                The present invention describes a neural thread protein (NTP) peptide
  New Harlil peptide sequences of the Neural Thread Protein, useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preventing and/or inhibiting cell death and/or tissue necrosis in a tissue for treating a neurodegenerative disorder, e.g. Alzheimer's disease, by contacting the live tissue with at least one segment of neural thread proteins (NTP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  용
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides (I).

It have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic sequences can be useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics. In particular, the peptides are also useful for diagnosics also assays and antibody new in the constant as a second for diagnosics. In particular, the peptides are also useful for diagnosics. Since a sea also useful as at second and antibody purification. The peptides are also useful as targets for drug development for the treatment of

The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB151 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides and can be used in peptide therapy. The Harlil peptide activities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic seasys by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics or disagnostics. In particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                      Neural thread protein; NTP; Harlil peptide; Alzheimer's disease; Down's syndrome; neuroectodermal tumour; astrocytoma; glioblastoma; hypoxia; ischaemia; cerebral infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neural thread protein, NTP; Harlil peptide; Alzheimer's disease; Down's syndrome; neuroectodermal tumour; astrocytoma; glioblastoma; hypoxia; ischaemia; cerebral infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 21; DB 5; Length 6; 100.0%; Pred. The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides (I) (I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used as nalogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are used in the harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics.
                                                                                                                                                                                            New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nootropic; neuroprotective; cell death; tissue necrosis; NTP; neural thread protein; neurodegenerative disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABB81511 to ABB81529 and thaving an amino acid sequence selected from ABB81511 to ABB81529 and thaving an entroperotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harill peptide sequences can be used as analogues for NTP in therapeutic or diagnostic sequences can be used an analogues for NTP in therapeutic or diagnostic peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harill peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics or disposate, bown's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                             New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neural thread protein; NTP; Harlil peptide; Alzheimer's disease;

The invention relates to a novel method for preventing and/or inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nootropic; neuroprotective; cell death; tissue necrosis; NTP;

The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABB81511 to ABB81529 and their homologues, which are referred collectively as Harill peptides (I).

(I) have neuroprotective, nootropic, vasotropic and cerebroprotective cativities, and can be used in peptide therapy. The Harill peptide sequences can be used in peptide therapy. The Harill peptide cassays by replacing NTP with the peptide in such an assay. The Harill peptide are also useful as a trap material in a diagnostic cassays, protein and antibody purification, therapeutics or diagnostics.

In particular, the peptides are also useful for diagnostics.

In particular, the peptides are also useful for diagnostics.

Colloblastomas, hypoxia, ischemmia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases
                                         The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Neural thread protein; NTP; Harlil peptide; Alzheimer's disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides and can be used in peptide therapy. The Harlil peptide activities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic sequences can be used as malogues for NTP in therapeutic or diagnostic seave by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABB81511 to ABB81529 and their homologues, which are referred collectively as Harlil peptides (I). (I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide casays by replacing NTP with the peptide in such an assay. The Harlil peptide says by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics. In particular, the peptides are also useful for diagnostics. Cin particular, the peptides are also useful for diagnostics. Cin particular, the peptides are also useful for diagnostics. Cin particular, the peptides are also useful for diagnostics. Ciloblastomas, hypoxia, ischaemia or cerebral infarction. The peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contexting the live tissue with at least one segment of neural thread proteins (WTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nootropic, neuroprotective, cell death, tissue necrosis, NTP, neural thread protein, neurodegenerative disorder, Alzhelmer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tissue for treating a neurodegenerative disorder, e.g. Alzheimer's disease, by contacting the live tissue with at least one segment of neural thread proteins (NTP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preventing and/or inhibiting cell death and/or tissue necrosis in a
                                       Preventing and/or inhibiting cell death and/or tissue necrosis in tissue for treating a neurodegenerative disorder, e.g. Alzheimer's disease, by contacting the live tissue with at least one segment oneural thread proteins (NTP).

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Noctropic; neuroprotective; cell death; tissue necrosis; NTP; neural thread protein; neurodegenerative disorder; Alzheimer's disease.

The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention

New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing these diseases.

Claim 3; Page 30; 53pp; English.

The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides (I).

(I) have neuroprotective, noctropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics.

motif for a cleavage site of a protease. The method comprises contacting the protease with a peptide library containing degenerate residues which allow for cleavage of a substrate by the protease, allowing the protease to cleave peptides within the degenerate peptide library having a cleavage site for the protease to form a population of cleavage peptides, and determining an amino acid sequence motif for the cleavage site of the protease. The protease of the method is a matrix metalloproteinase, or a protease. The protease of the method is a matrix metalloproteinase, or a protease is a lethal factor of B. anthracis, pla and Yopy protease of the invention is selected from a protease of pathogenic organisms, cathegain

The invention relates to a method for determining an amino acid

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of \mathbf{8} - 313 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) c); or (e) a nucleic acid encoding the polypeptide of (a)-(d). (T) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the disgnosis and/or treatment of viral infections, cancers and tumoure. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection; cancer; tumour; human; PRAME.

proteases affecting the blood clotting cascade. The protease inhibitors for the invention are useful to treat diseases, including pathogenic infections, cancer, and inflammatory diseases. This sequence represents a peptide sequence relating to the protease cleavage site motifs of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nootropic, neuroprotective, cell death, tissue necrosis, NTP, neural thread protein, neurodegenerative disorder, Alzhelmer's disease.

Selecting and/or producing a T cell epitope useful in a vaccine comprises subjecting a precursor peptide or polypeptide to the action of a 20S proteasome to determine the location of the C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selecting and/or producing a T cell epitope useful in a vaccine comprises subjecting a precursor peptide or polypeptide to the action of a 20S proteasome to determine the location of the C-terminus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method of producing T cell epitopes, involving subjecting a precursor peptide to the action of a 208 proteasome, in order to locate the C-terminus of said epitope. This can be used in the production of vaccines, which can then be used to provoke a T cell response in the treatment of diseases such as cancer and infections The present sequence is a peptide described in the exemplification of the invention
                                                                                                                                 The present invention describes a method of producing T cell epitopes, involving subjecting a precursor peptide to the action of a 208 proteasome, in order to locate the C-terminus of said epitope. This can be used in the production of vaccines, which can then be used to provoke a T cell response in the treatment of diseases such as cancer and infections. The present sequence is a peptide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine; immune response; T cell response; epitope; proteasome; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a polypeptide (I) comprising a component defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having similarity to any of (a) c); or (e) a mucleic acid encoding the polypeptide of (e) a mucleic acid encoding the polypeptide of (a) in the soluppeptide of (a) in the polypeptide of (a) contains a polypeptide of (a) contains and compositions of the present infections; cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                          New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              response; T cell response; epitope; proteasome; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 6 +33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) (b) and to caid encoding the polypeptide of (a) - (d), or (e) a nucleic acid encoding the polypeptide of (a) - (d). (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the disgnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                 epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection; cancer; tumour; human; PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.

(I) has vinucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
epitope, epitope cluster; virucide, cytostatic; vaccine, viral infection; cancer; tumour; human; PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              epitope, epitope cluster, virucide, cytostatic, vaccine, viral infection, cancer, tumour, human, PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention describes a polypeptide (I) comprising a component defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) -(c); or (e) a uncleic acid encoding the polypeptide of (a) -(d). (I) has vincide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumoure. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 21; DB 8; Length 9; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a), (c); or (e) a nucleic acid encoding the polypeptide of (a) - (d), (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the disapnosis and/or trearment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                        New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Claim 1; SEQ ID NO 397; 357pp; English.

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-13 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a). (c); or (e) a nucleic acid encoding the polypeptide of (a) - (d). (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein having desired immunological and functional properties comprising one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic content to parent protein. The method comprises generating, from a parent protein having desired immunological and functional properties, the desired immunological property is reduced or enhanced immunogenicity. The immunogenic sequence or property is reduced or enhanced immunogenicity. The immunogenic sequence of selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen comprises a function that predicts antigen that predicts class I MHC agretopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor computational protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is experimentally generating the variant protein to a patient. The method is useful for generating a the variant protein to a patient. The method is useful for generating a

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein having desired immunological and functional properties comprising one or more variant sequences comprising an aminon acid substitution of a position of the first immunogenic comparison as equence in the parent protein. The method comprises generating, from a sequence in the parent protein having desired immunological and cuptake by antigen presenting cells (APCs). The desired immunological and property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen cleavage sites. The immunogenicity filter comprises a function that predicts antigen comprises a function that predicts antigen comprises a function that predicts antigen comprises a function that predicts antibody epitopes. The computational comprises a function that predicts antibody epitopes. The computational creams selected from the list: van der Waals, hydrogen bonding, computational protein design algorithm is used to assess the stability of computational protein design algorithm is used to assess the stability of
                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).
                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          from a parent protein, a variant protein having desired

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein. The method comprises generating, from a parent protein having desired immunological and functional properties, the desired immunological property is enhanced uptake by antigen presenting cells (APCs). The desired immunological property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, a class II MHC agretope, and an antibody epitope. The munogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts class I or class II MHC agretopes. The immunogenicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
said variant protein. The computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA (RTM) technology. The method further comprises experimentally generating the variant protein, recovering the variant protein, and administering a variant protein to a patient. The method is useful for generating a variant protein to a patient. The method is useful for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).
                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          class II MHC-binding less immunogenic variant #129.

                                                                         electrostatics, solvation, and secondary structure propensity. The computational protein design algorithm is used to assess the stability of said variant protein design algorithm is used to assess the stability of assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA or ligand molecules. The computational protein design algorithm is PDA the variant protein, recovering the variant protein, and administering the variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological senanced uptake by antigen presenting cells (APCs). The desired immunological
                    comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more terms selected from the list: van der Waals, hydrogen bonding,

property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The campules a function that predicts antigen immunogenicity filter comprises a function that predicts antigen comprises a function that predicts comprises a function. The immunogenicity filter comprises a function. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational comprises a scoring function with two or more computational algorithm comprises a scoring function with two or more centrostatics, solvation, and secondary structure propensity. The computational protein design algorithm is used to assess the affainty of said variant protein the computational protein design algorithm is used to assess the affainty of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA (RTW) technology. The method further comprises experimentally generating the variant protein, recovering the variant protein, and administering the variant protein with altered immunogenicity, preferably for identifying contains that increase or decrease the immunogenicity of a protein contain moliary neurotrophic factor (CNTR).

Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or mor variant sequences with an amino acid substitution in the parent protein.

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional Example 9; Page 65; 69pp; English

properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein, a variant protein having dealred immunological and functional properties, the desired immunological property is enhanced uptake by antique presenting cells (APCS). The desired immunological compression antique processing cleavage site, a class I MHC agrecope, and an antibody epitope. The immunogenic sequence is selected from an antique processing cleavage sites. The immunogenic sequence comprises a function that predicts antipody epitope. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The sequence computational protein design algorithm is used to assess the stability of said variant protein. The computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is used to assess the affinity of said variant protein; recovering the variant protein in a patient. The method is useful for generating the variant protein with altered immunogenity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II ö Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more Gaps ; 0 Human CNTF class II MHC-binding less immunogenic variant #49.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                              The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional proteins a variant protein of a postition of the first immunogenic properties comprising an amino acid substitution of a postition of the first immunogenic from a maino acid substitution of a postition of the first immunogenic from a parent protein, a variant protein having desired immunological and the parent protein, a variant protein having desired immunological and the property is reduced or enhanced immunogenic munological property is reduced or enhanced immunogenic sty. The desired immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenic sequence is selected from an antises a function that predicts artises a function that predicts class I MHC agretopes. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more comprises a function that predicts antibody epitopes. The computational protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is to the variant protein of a protein. The computational protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is convering the variant protein of a protein. The method is useful for generating the variant protein of a petient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                         or more
                                                                                                                                                                   Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human CNTF class II MHC-binding less immunogenic variant #13.

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein naving desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic comprising desired protein, a variant protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological and functional property is reduced or enhanneed immunogenic sty. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, a class IN MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts antigen or the immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more terms selected from the list; van der Maals, hydrogen bonding, a lectrostatics, solvation, and secondary structure propensity. The computation, and secondary structure propensity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is been to a sesses the affinity of said variant protein design algorithm is perfect or ligand molecules. The computational protein design algorithm is perfect or layers that increase or decrease the immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity, of a protein by affecting antigen uptake. The present sequence represents a class II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising one or more variant sequences comprising one or more variant sequences comprising comparison of a postition of the first immunogenic from a maino acid substitution of a postition of the first immunogenic, from a parent protein. The method comprises generating, from a parent protein having desired immunological and functional properties, the desired immunological property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more computational protein design algorithm is used to assess the stability of said variant protein. The computational protein for one or more receptor or ligand molecules. The computational protein for one or more receptor or ligand molecules. The computational protein for one or more receptor or ligand molecules. The computational protein for one or more the variant protein to a patient. The method is useful for generating the variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class I

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a postition of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological property is enhanced comprises immunogenic sequence by antigen presenting cells (APCs). The desired immunological comprises by antigen processing cleavage site, a class I MHC agretope, a class II MHC agretope, and an antibody epitope. The immunogenic sequence comprises a function that predicts antigen processing cleavage site, a class I MHC comprises a function that predicts antigen comprises a function that predicts comprises a function that predicts comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more clear selected from the list; wan der Maals, Mydrogen bonding, and the comprises a scoring function with two or more clear selected from the list; wan der Maals, Mydrogen bonding, and the comprises a comprise or comprise a function that predicts antibody epitopes. The computational comprises a scoring function with two or more clear selected from the list; wan der Maals, Mydrogen bonding, and comprise the computational comprises a scoring function with two or more clear selected from the list; wan der Maals, Mydrogen bonding. variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein naving desired immunological and a maino acid substitution of a position of the first immunogenic comprising an amino acid substitution of a position of the first immunogenic from a maino acid substitution of a position of the first immunogenic, from a parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional property is reduced or enhanced immunological property is seduced or enhanced immunogenic tor. The desired immunological made is selected from an antigen processing cleavage site, a class I MHC agretope, a class II MHC agretope, and an antibody epitope. The immunogenic try filter comprises a matrix method calculation. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more terms selected from the list: van der Waals, hydrogen bonding, electrostatics, solvation, and secondary structure propensity. The computational protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is to computational protein design algorithm is used to assess the affinity of said variant protein design algorithm is to computational protein design algorithm is used to assess the affinity of said variant protein design algorithm is ponentating the variant protein variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological property is enhanced cuptake by antigen presenting cells (APCs). The desired immunological compressed in the property is enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a matrix method calculation with two or more protein design algorithm comprises a scoring function with two or more comprises elected from the list; wan der Walls, hydrogen bonding, more electrostatics, solvation, and secondary structure propensity. The computational protein design algorithm is used to assess the stability of said variant protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA (RTM) technology. The method further comprises experimentally generating the variant protein, recovering the variant protein, and administering the variant protein to a patient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic an amino acid substitution. The method comprises generating, from a parent protein, a variant protein. The method comprises generating, from a contraint protein in a variant protein having desired immunological and functional properties, the desired immunological immunological immunological immunological immunological immunological immunological immunological immunological and comprises a class II MHC agretope, and an antigen processing cleavage site, a class I MHC agretope, a class II MHC agretope, and an antibody epitope. The immunogenic sequence immunogenic sequence comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more comprises a function that predicts antibody epitopes. The computational protein design algorithm is used to assess the stability of said variant protein. The computational protein design algorithm is used to assess the stability of said variant protein. The computational protein design algorithm is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      more.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or morvariant sequences with an amino acid substitution in the parent protein.
  decrease the immunogenicity of a protein
                   by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).
                                                                                                                                                                   Gaps
                                                                                                                                                                   ;

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic an amino acid substitution of a position of the first immunogenic parent protein, a variant protein. The method comprises generating, from a contributional properties, the desired immunological and cunctional properties, the desired immunological property is enhanced uptake by antigen presenting cells (APCs). The desired immunological cuptake by antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenic representable in the immunogenic sequence immunogenicity filter comprises a function that predicts antigen processing cleavage site, a class I were immunogenicity filter comprises a function. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter
                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
to assess the affinity of said variant protein for one or more receptor or ilgand molecules. The computational protein design algorithm is PDA (RTM) technology. The method further comprises experimentally generating the variant protein, recovering the variant protein, and administering the variant protein to a patient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).
                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human CNTF class II MHC-binding less immunogenic variant #8

comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more terms selected from the list: van der Waals, hydrogen bonding, clectrostatics, solvation, and secondary structure propensity. The computational protein design algorithm is used to assess the stability of said variant protein. The computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA (RTM) technology. The method further comprises experimentally generating the variant protein, recovering the variant protein, and administering the variant protein with altered immunogenicity, preferably for identifying wariant protein with altered immunogenicity, preferably for identifying condifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF). 888888888888888888

Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.

Example 8; Page 61; 69pp; English.

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological property is enhanced uptake by antigen presenting calls (APCs). The desired immunological property is reduced or enhanced immunogenicity. The immunogenic sequence

agretope, a class II MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts antigen from processing cleavage sites. The immunogenicity filter comprises a function that predict antibody epitopes. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more computational protein design algorithm is used to assess the stability of adid variant protein design algorithm is used to assess the atbility of computational protein for one or more receptor to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA consists the affinity of said variant protein in recovering the variant protein to a patient. The method is useful for generating the variant protein to a patient. The method is useful for generating the variant protein to a patient. The method is useful for generating modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF). \$

having an amino acid sequence selected from ABBBISI to ABBBISS and their homologues, which are referred collectively as Harlil peptides (I).

Their homologues, which are referred collectively as Harlil peptides (I).

Cativities, and can be used in peptide therapy. The Harlil peptide (I).

Sequences can be used as analogues for NTP in therapeutic or disgnostic sequences can be used as analogues for NTP in therapeutic or disgnostic peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics.

In particular, the peptides are also useful for diagnostics.

In particular, the peptides are also useful for diagnostics.

Ciscase, Down's syndrome, neuroectodermal tumours, astrocytomas, also useful as targets for drug development for the treatment of these diseases. The present sequence represents a specifically claimed
                                  The present invention describes a method of producing T cell epitopes, involving subjecting a precursor peptide to the action of a 20S proteasome, in order to locate the C-terminus of said epitope. This can be used in the production of vaccines, which can then be used to provoke a T cell response in the treatment of diseases such as cancer and infections. The present sequence is a peptide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-133 amino acids (SEO ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) -(c); or (e) a mucleic acid encoding the polypeptide of (a)-(d). (I) has vinucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      epitope, epitope cluster; virucide, cytostatic; vaccine; viral infection; cancer; tumour; human; PRAME.
                                                                    epitope, epitope cluster; virucide, cytostatic; vaccine, viral infection; cancer; tumour; human, PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 10;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                      Nootropic; neuroprotective; cell death; tissue necrosis; NTP; neural thread protein; neurodegenerative disorder; Alzhelmer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) -(c); or (e) a nucleic acid encoding the polypeptide of (a)-(d). (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a polypeptide (I) comprising a component defined from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having substantial similarity to any of (a)-(c); or (e) a mucleic acid encoding the polypeptide of (a)-(d). (1) has virucide and cytostatic acid the present invention are useful for the disgnosis and compositions of the present invention are useful for the disgnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection; cancer; tumour; human; PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                      Length 10;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                               The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (C) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a)-(c); or (e) a nucleic acid encoding the polypeptide of (a)-(d). (I) has virucide and cyrostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                epitope, epitope cluster, virucide, cytostatic, vaccine, viral infection, cancer, tumour, human, PRAME.
                                                                                                                                                                                              New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.

which are recognized by autoantibodies (AAb) directed against human
thyroperoxidase (hTPO). (I) comprise a discontinuous epitope derived from
the discontinuous immunodominant region of hTPO, consisting of four
distinct regions that are homologous to MPO (myeloperoxidase) or CCP
(complement-control protein). (I) contain at least one of the cryptic
motifs given in ADP04325-ADP04327. The discontinuous epitope comprises
hTPO regions 353-363 (ADP04309); 377-386 (ADP04310) and 713-720
(ADP04111) of the MPO homology domain and 766-775 (ADP04112) of the CCP
homology domain. (I) are used to detect AAb, particularly for diagnosis
of autoimmune diseases (especially of the thyroid, e.g. Graves' and
shahmoto diseases) or thyroid cancers. Also (I), and anti-TPO antibodies
that recognize them, are useful for treating these diseases. To
illustrate the invention, TPO mutaits were made. The present sequence is
the wild-type peptide sequence which was replaced with the ADP04328

The present sequence represents a peptide ligand which binds to human MUC1 protein. MUC1 is an epithelial cell mucin, which is found on, and shed from, the surface of many tumours. MUC1 peptide ligands were isolated using a phage display technique using MUC1 tandem repeats as the target. The MUC1 tandem target repeats comprise repeats of the peptide sample, to treat or prevent cancer associated with MUC1 and to prevent associated with MUC1 and to prepare a medicament or diagnostic agent to treat, prevent or detect cancer associated with MUC1 and to prepare a associated with MUC1 and to prepare a associated with MUC1 and to prepare and MUC1 in a sample diagnosis or monitoring of cancer can be carried out. The ligands may also be used to prepare antibodies
                                                                                                         Novel ligands that binds to MUC1, an epithelial cell mucin, useful for diagnosing, monitoring, treating and preventing cancer.

                                                                                                                                                                                                                                                                                                         The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and the chart homologues, which are referred collectively as Harili peptides (I).

(I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harili peptide sequences can be used in peptide therapy. The Harili peptide seasys by replacing NTP with the peptide in such an assay. The Harili peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harili peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostic assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostic Alsheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, colloblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these and also useful as targets for drug development a specifically claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                       New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTF). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABB81511 to ABB81529 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                 Preventing and/or inhibiting cell death and/or tissue necrosis in a tissue for treating a neurodegenerative disorder, e.g. Alzheimer's disease, by contacting the live tissue with at least one segment of neural thread proteins (NTP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Neural thread protein; NTP; Harlil peptide; Alzheimer's disease;
Down's syndrome; neuroectodermal tumour; astrocytoma; glioblastoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 12;

The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP
their homologues, which are referred collectively as Harlil peptides (I) (I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases. The present sequence represents a specifically claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nootropic; neuroprotective; cell death; tissue necrosis; NTP;

The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, hood pressure disorders, scleropis, male infertility, hypercalcaemia, blood pressure disorders, autoimmunity. The present sequence is a peptiide encoded by a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLB), vascultis, glomerullonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous seteoporosis, male infertility, hypercalcaemia, blood pressure disorders, seteoporosis, pathogenic infections, hypercholeercolaemia, obesity or autoimmunity. The present sequence is a peptide encoded by a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated human polynucleotides containing single nucleotide polymorphisms, useful for the treatment and diagnosis of e.g. cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes an NTP-peptide (I) comprising at least one amino acid sequence corresponding to part of the amino acid sequence of a central thread protein. ADYC-TMP. The invention provides a method of treating a condition requiring removal or destruction of cells of a mammal comprising administered to the mammal, a therapeutic amount of (I). The treatment is administered to the mammal before, during or after cure therapy, vaccination, thermal or electrical ablation, rip method is immunotherapy, vaccination, thermal or electrical ablation, cryotherapy, immunotherapy, phototherapy, gene therapy and/or radiation. The method is useful for treatment of benign or malignant tumour; hyperplasia, hypertrophy or overgrowth of tissue; virally, bacterially or breast, stomach, pancreas, prostate, bladder, bone, ovary, skin, kidney, breast, stomach, pancreas, prostate, bladder, bone, ovary, skin, kidney, slanus, colon, intestine, rectum, esophagus, heart, spleen, salivary corrective organs, liver, hair, gall bladder, eye, ear, nose, throat, conscitute and lymph nodes and lymphoid system; tonsilary, connective organs, internymb nodes and lymphoid system; tonsilary, warions, inflammacory disease; autoimmune disease; hereditary/genetic disease; recommential disease; muthing inflammacory disease; recommential disease; muthing inflammacory disease; recommental of sease; anyloid disease; exprenditary/genetic disease; recommental disease; engisted is earges.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disease. This is the amino acid sequence of a human neural thread protein AD7C-NTP peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       deficiency disease; poisoning; intoxication; environmental disease; radiation disease; endocrine disease; degenerative disease and mechanical
                                                                                                                                                                                                                                                                    Novel peptides similar in amino acid sequence to neural thread proteins (NTP), useful for treating unwanted cellular proliferations such as malignant tumors and prostatic hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nootropic; neuroprotective; cell death; tissue necrosis; NTP; neural thread protein; neurodegenerative disorder; Alzhelmer's disease.

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Papillomavirus; PV; infection; cell proliferation; B2; peptidomimetic; B1; antiviral; virucide; cytostatic; antiproliferative; dermatological; preneoplastic lesion; neoplastic lesion; cutaneous lesion; wart; epidermodysplasia verruciformis; anorectal carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of papillomavirus E2 protein peptidomimetics for treating papillomavirus-infected cells and papillomavirus-induced conditions in mammals by inhibiting E1-E2 interaction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                  The present invention describes the use of a small organic compound (A) which competitively inhibits interaction of a papillomavirus (PV) E2 protein with a PV all protein for treating a cell infected with PV or a mammal with a PV-induced condition. (A) has antiviral, virucide, cytostatic, antiproliferative and dermatological activities. Methods from the present invention can be used to treat PV-induced conditions including growth of PV preneoplastic and neoplastic lesions, cutaneous lesions chosen from warts and other benign cutaneous lesions, plantar arts, flat warts, gential warts (condyloma acuminatum) and carts, flat warts, gential warts (condyloma acuminatum) and cother upper airway papilloma or vaginal, cervical, planyagaal, osophageal and other upper airway papilloma or vaginal, cervical, vulvar, penile and anocettal carcinoma. The E2 inhibitors may also be used to treat epitealial and internal fibropapilloms in animals. The present sequence represents a peptide sequence used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Focht MSS, Bibiano

New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing WPI; 2002-507998/54.

Claim 3; Page 30; 53pp; English.

The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABB81511 to ABB81529 and their homologues, which are referred collectivelly as Harlil peptides (I). (I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide

assays by replacing NTP with the peptide in such an assay. The Harilipeptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harilipeptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics in particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases. The present sequence represents a specifically claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel method for preventing and/or inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (MTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       neural thread protein; neurodegenerative disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Preventing and/or inhibiting cell death and/or tissue necrosis in a tissue for treating a neurodegenerative disorder, e.g. Alzheimer's disease, by contacting the live tissue with at least one segment of neural thread proteins (NTP).
                                                                                                                                                                                                                                                                                                        ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nootropic; neuroprotective; cell death; tissue necrosis; NTP;

New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing these diseases.

Claim 3; Page 29; 53pp; English.

having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Haril peptides (I) their homologues, which are referred collectively as Haril peptides (I). An are neuroprotective, noctropic, vasotropic and cerebroprofective cativities, and can be used in peptide therapy. The Harili peptide sequences can be used as analogues for NTP in therapeutic or diagnostic sessays by replacing NTP with the peptide in such an assay. The Harili peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harili peptides are useful in binding assay, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrom, neuroectodermal tumours, astrocytomas, globlastomas, hypoxia, ischaemia or cerebral infarction. The peptides care also useful as targets for drug development for the treatment of these diseases. The present sequence represents a specifically claimed peptide from the present invention The present invention describes a neural thread protein (NTP) peptide

Novel peptides similar in amino acid sequence to neural thread proteins (NTP), useful for treating unwanted cellular proliferations such as malignant tumors and prostatic hyperplasia.

Claim 3; Page 15; 78pp; English.

The invention describes an NTP-peptide (I) comprising at least one amino acid sequence corresponding to part of the amino acid sequence of a neural thread protein. AD7C-TMP. The invention provides a method of treating a condition requiring removal or destruction of cells of a mammal comprising administered to the mammal, a therapeutic amount of (I). The treatment is administered to the mammal before, during or after surgical excision, transplantation, grafting, chemotherapy, vaccination, thermal or electrical ablation. The method is unmunotherapy, phototherapy, gene therapy and/or radiation. The method is useful for treatment of benign or malignant tumour; hyperplasia, hypertrophy or overgrowth of tissue; virally, bacterially or parasitically altered tissue; malformation of tissue selected from lung, consisting stomach, pancreas, prostate, bladder, bone, ovary, skin, kidney, sinus, colon, intestine, rectum, esophaque, heart, spleen, salivary cland, blood, brain and its coverings, spinal cord, muscle, connective tissue, adrenal parathyroid, thyroid, uterus, testis, pituitary, reproductive organs, liver, hair, gall bladder, eye, ear, nose, throat, consils, mouth and lymph nodes and lymphoid system; tonsillary thyertic hypertrophy; prostatic hyperplasia; commettic notation to a tissue; hypertrophy; prostatic hyperplasia; commettion to a tissue; vascular disease (atherosclerosis or arteriosclerosis); haemorrhoids, varicose veins; inflammatory disease; autoimmune disease; metabolic disease; harediteary/genetic disease; traumatic disease; physical injury; nutritional deficiency disease; infectious disease; amyloid disease; fibrosis disease; storage disease; congenital malformation; enzyme deficiency disease; poisoning; intoxication; environmental disease; radiation disease; endocrine disease; degenerative disease and mechanical disease. This is the amino acid sequence of a human neural thread protein AD7C-NTP peptide fragment

N/Alternate names: pemk-like protein 2
C/Species: Escherichia coli
C/Species: Escherichia coli
C/Accession: D49339; 856451; D6534
R/Masuda, Y.; Myakawa, K.; Nishimura, Y.; Ohtsubo, E.
A/Title: ChDA and ChpB, Escherichia coli chromosomal homologs of the pem locus responsib
A/Reference number: A49339; MuID:94042847; PMID:8226627
